

TF60

Our strive for consistent improvement: One feeder for all studs, maximum technical availability with a minimum of maintenance

Challenges in the automotive industry:

Process stability and technical availability – key imperatives for body shop equipment. When it comes to stud welding feeding of the stud is key to ensure technical availability.

Our solution:

Based on the very successful TF2X feeder generation we equipped our escapement with a linear vibrator module to guarantee flawless feeding function. The TF60 will be the successor model for TF2X and TF1X

At the fair....

... we are pleased to present the TF60 to the public for the first time. This unit can be opened up so you can see and understand how this feeder will significantly help reduce your total cost of ownership (TCO) and maintenance.
